

# Caribbean Risk Managers Ltd

## Natural Hazards Risk Assessment

CaribRM has developed a broad range of expertise and experience as a Caribbean- and Americas-focussed natural hazards and catastrophe risk consultancy. Utilising in-house hazard and risk modelling capabilities and with support from numerical hazard modelling company, Kinetic Analysis Corporation, CaribRM builds bespoke catastrophe risk models on a client-specific basis. Models enable quantification of catastrophe risk through provision of scenario-based probable maximum loss (PML) estimates and full loss exceedance curve outputs. Models are designed to fully utilise available and newly collected data and provide meaningful uncertainty estimates. Our catastrophe risk models are able to replicate losses for individual or multiple risk locations anywhere in the Caribbean Basin and Latin America.

CaribRM also provides advisory services to users of third-party catastrophe models, helping to unravel the inner workings of the 'black-box' solutions provided directly by modelling companies or via brokers. Understanding the input data and modelling process is vital in maximising the benefits of outputs.

CaribRM's risk surveying unit provides support to clients in characterising and controlling their risks. We have survey teams working out of both our Jamaica and Barbados offices, covering the entire Caribbean Basin and specialising in natural hazards risk. Surveyors have a

detailed regional knowledge and strong technical experience, particularly in the hotel sector. CaribRM has built in-house data collection and management systems to ensure quality control and client satisfaction.

CaribRM's risk assessment team also provides rapid and independent assessments of catastrophe events from both a hazard and loss perspective, and also offers independent advice on the science of natural hazards, including hurricane tracking and impact forecasting. We distribute a quarterly bulletin describing natural hazards events across the broader Caribbean Basin as well as individual post-event bulletins. Client-focussed real-time updates are also provided via secure client login to our servers.
